RYAN EBALLAR

WEB AND MOBILE APPLICATION DEVELOPER

ABOUT

Ryan is a senior frontend engineer from Cebu, Philippines, with a Bachelor of Science in Information Technology from the University of Cebu. For the past several years, his work has centered around modern JavaScript and TypeScript ecosystems, focusing heavily on React.js, Next.js, and Node.js.

He builds production-ready web applications, designs scalable frontend architectures, and maintains both modern and legacy systems. His experience spans a wide set of technologies, including React Native/Expo, Storybook, Contentful and Payload CMS, Express.js, Docker, and CI/CD pipelines using Bitbucket Pipelines and GitLab. He also develops private internal NPM packages that serve as shared tooling for both internal teams and external SaaS products.

Beyond frontend development, Ryan is deeply involved in engineering workflows and developer experience. He creates company-wide DX tools, automates builds and deployments, and supports engineering teams through improved processes, documentation, and reusable systems. He also maintains legacy games built with Phaser and Backbone, and builds new games or ports older ones into React-based systems, often integrating real-time features using Socket.io.

He values continuous delivery, test automation, clean code, and building practical frameworks that fit the team's culture rather than following rigid methodologies. Ryan actively supports open-source projects and encourages other developers to contribute and grow within the community.

WORK EXPERIENCE

Parlay Games Inc.

https://www.parlaygames.com/

June 2021 – Present

Lead Software Engineer

Parlay Games Inc. develops and licenses industry leading software products that empower our clients ability to attract, engage, and entertain online customers and social communities.

Highlights

- Designed and maintained Docker setups for both development and production environments.
- Upgraded and refined existing asset pipelines and created new pipelines that integrate across various services to automate builds and deployments through GitLab CI. This includes developing private NPM packages and Docker images stored in the GitLab NPM Registry and Container Registry. I also manage Bitbucket Pipelines for partner teams to support shared services and produce the necessary Docker images.
- Lead and mentor frontend developers to ensure code quality, technical growth, and consistent engineering practices.
- Develop developer experience tools that are used internally by our engineering teams and externally by clients.
- Build and maintain private NPM packages that support both internal systems and the company's SaaS offerings.
- Implement and manage Contentful as a CMS, including creating migration scripts that serve internal projects and SaaS integrations.
- Create and maintain legacy bingo and casino games built using Phaser and Backbone.
- Utilize Socket.io to manage real time game services and chat systems.
- Implement e commerce lobby systems used across our SaaS platforms.
